The most recent poverty estimate from the Uganda National Household Survey 2019/20 (UNHS) is equal to 20.3 percent, based on the national poverty line. If split into pre-COVID-19 and pandemic time, the UNHS 2019/20 shows a decline in poverty from 21.4 percent in 2016/17 to 18.7 percent in 2019 before the COVID-19 outbreak and a subsequent increase in poverty to 21.9 percent afterwards. The Uganda Bureau of Statistics (UBOS) has also released new poverty rates using a revised poverty line. According to the revised line, the national poverty rate in 2019/20 was about 30 percent, being closer to but still lower than the international poverty rate of 42.2 percent. The annualized consumption growth for the bottom 40 percent of population during 2016/17 and 2019/20 was close to zero, but still slightly higher than the negative mean consumption growth of -0.26 percent. Lower work stoppages in the agriculture sector during COVID-19 and favorable weather conditions in 2019 and 2020 likely helped the most vulnerable to sustain positive consumption growth on average. Multidimensional poverty declined between 2016/17 and 2019/20 mainly due to increased access to electricity through wider usage of solar panels, but still remained higher than 50 percent.

Regarding the most recent outcomes, the High-Frequency Phone Survey conducted in June/July 2022 showed that the employment rate was about 79 percent, similar to the level observed in October/November 2021 after the second lockdown. Food insecurity remained very high in June/July 2022 with half of the population being moderately food insecure and about 13 percent severely food insecure. Households, in particular the poorest ones, are being negatively affected by increased prices, either through being unable to access food products or to buy the desired amounts. Less than half of population were able to access and buy desired amounts of beef, sugar, cooking oil, gasoline and soap when needed. Weather shocks could also be responsible for higher food insecurity as two thirds of households reported being affected by either droughts, irregular rainfall, or floods during the last 12 month. Weather shocks, food inflation and COVID-19 can limit the positive impact from the expected acceleration of economic growth in 2023 and 2024.

POVERTY DATA AND METHODOLOGY

Uganda is one of the few countries in the region to have frequent high-quality surveys to monitor the overall wellbeing and poverty level of the population, and scores 71 (out of 100) in the Statistical Capacity Index. The Uganda Bureau of Statistics (UBOS) has conducted household surveys (Uganda National Household Survey-UNHS) every three to four years since the 1990s. Results from the most recent UNHS survey conducted in 2019/20 were announced in summer 2021. The data collection was done in September 2019-February 2020 and July 2020-November 2020 with a break during the strict lockdown in March-June 2020. Uganda uses the cost-of-basic needs method to measure the level of poverty. It estimates the expenditure needed to satisfy a minimum caloric requirement (3,000 kcal per adult equivalent) and basic non-food needs (the non-food expenditure of those households on the food poverty line). There are adjustments for differences in regional prices and for changes in prices during the duration of the survey. The current national poverty line was set in 1998 (using 1993 data) and it might no longer reflect the reality in which poor Ugandan households live. In order to address this issue, UBOS has estimated a new poverty line using consumer basket from 2016/17 year. The new poverty line, called upper poverty line, resulted in shift of poverty rates from about 20 to 30 percent in 2019/20. The new poverty rate is still lower than poverty obtained from using international poverty line of 2.15 USD 2017 PPP which is based on the median of the national poverty lines of 28 of the world’s poorest countries, expressed in 2017 PPPs.

Note on new global poverty lines: Poverty data are now expressed in 2017 Purchasing Power Parity (PPP) prices, versus 2011 PPP in previous editions. As price levels across the world evolve, global poverty lines have to be periodically updated to reflect the increase of the value of the lines in nominal terms. The new global poverty lines of $2.15, $3.65, and $6.85 reflect the typical national poverty lines of low-income, lower-middle-income, and upper-middle-income countries in 2017 prices. In addition to reflecting updates in nominal terms, upper-middle-income countries raised the standards by which they determine people to be poor from 2011 to 2017. Hence, the increase in the upper line is larger, and the population that does not meet the new standard is higher in most countries than it was with 2011 PPPs. See pip.worldbank.org.

HARMONIZATION

The numbers presented in this brief are based on the SSAPOV database. SSAPOV is a database of harmonized nationally representative household surveys managed by Sub-Saharan Team for Statistical Development. It contains more than 100 surveys covering 45 out of the 48 countries in the SSA region. The three countries not covered in the database are Eritrea, Equatorial Guinea, and Somalia. Terms of use of the data adhere to agreements with the original data producers.
